

APPENDIX C

SOIL PATHWAY

This appendix describes the methods used to derive the activity specific body-weighted soil adherence factors and is divided into four sections: (1) Background; (2) Body Part-Specific Surface Areas and Activity-Specific Soil Adherence Factors; (3) Overall Weighted Soil Adherence Factors; and (4) soil loading at the hypothetical mono-layer for the Soil Conservation Service standard soil classifications.

Background

Recent data from Kissel *et al.* [Kissel *et al.* (1996a), Kissel *et al.* (1996b), Kissel *et al.* (1998), and Holmes *et al.* (1999)] provide evidence to demonstrate that:

- Soil properties influence adherence;
- Soil adherence varies considerably across different parts of the body; and
- Soil adherence varies with activity.

Given these results, the EPA now recommends that an activity which best represents all soils, body parts, and activities be selected (U.S. EPA, 1997a). Body-part-weighted AFs can then be calculated and used in estimating exposure via dermal contact with soil based on assumed exposed body parts. Data on body-part-specific AFs for specific activities are summarized in Exhibit C-2 and were taken from *Exposure Factors Handbook* (U.S. EPA, 1997a), Table 6-12 and from Holmes *et al.* (1999). The raw data are available electronically at <http://depts.washington.edu/jkspage> as presented in Exhibit C-2. These body-part-specific adherence data are then combined as a surface weighted average and 95th percentile for each activity using the exposed body parts that are listed for each scenario. The surface area calculations are presented in Exhibit C-1 and the overall values in Exhibit C-3 and Exhibit 3-3.

Body-Part-Specific Surface Areas

The surface area parameter (SA) describes the amount of skin exposed to the contaminated media. The

amount of skin exposed depends upon the exposure scenario. Clothing is expected to limit the extent of the exposed surface area in cases of soil contact. All SA estimates used 50th percentile values to correlate with the

<u>Surface Area by Body Part (cm²)⁷</u>												
<1 to <6	977	326	874	393	358	1624	650	451				
<7 to <18	1276	425	1749	787	700	4026	1610	949				

1. Taken from Exposure Factors Handbook 1997, Table 6-8.

3. Face SA was assumed to be 1/3 of head SA.

5. Due to lack of data for indicated ages, it was assumed that children <1 and 1<2 yr old had the same total SA as children 2<3 yr old.

7. Body-part-weighted SA for children was calculated by multiplying body-part-specific fraction of total SA by total SA (avg. of male and female). Adult body-part SA was taken from 50%tile body-part SA (avg. of Male/Female). All areas reported to two significant digits.

2. Taken from Exposure Factors Handbook 1997, Table 6-6 (male) and Table 6-7 (female).

4. Assumed forearm-to-arm ratio (0.45) and lowerleg-to-leg ratio (0.4) equivalent to an adult.

6. Due to lack of data for indicated ages, it was assumed that body-part-specific fraction of total SA was equal to that of the next oldest age with data.

8. Taken from Exposure Factors Handbook 1997, Tables 6-2 (male) and 6-3 (female).

Daycare Children No. 2 from 1997 *Exposure Factors Handbook* (U.S. EPA, 1997), Table 6-11, and Indoor Children Nos 1 & 2 were combined.

average body weights used for all scenarios and pathways. This was done to prevent inconsistent parameter combinations as body weight and SA are dependent variables. Body part-specific SAs were calculated as described under Chapter 3 for adult (>18 years old), teenager (>6 to <18 years old), and child (<1 to <6 years old) receptors and documented in Exhibit C-1.

Weighted Soil Adherence Factors

Given that soil adherence is dependent upon the body part, it is necessary to calculate an overall body part-weighted AF for each activity. The assumed clothing scenario determines which body part-specific AFs are used in calculating the 50th and 95th percentile weighted AFs. The weighted AFs are used in combination with the relative absorption, exposure frequency and duration, exposed surface area, body weight, and averaging time to estimate the dermally absorbed dose. Details on the methods used to calculate the overall weighted AFs are contained under Chapter 3 of the document. The results from the supporting calculations are shown in Exhibit 3-3.

Mono-layer Soil Loading for SCS Soils.

The range of possible soil adherence factors (AF) was calculated using the Soil Conservation Service (SCS) textural classes and the Duff and Kissel (1996) equation for a mono-layer, assuming spherical particles and face-centered packing,

$$AF_{\text{monolayer}} = \left[P_{\text{particle}} \frac{1d^3}{6d^2} \right] = P_{\text{particle}} \frac{1d}{6}$$

using the SCS arithmetic mean particle diameter and particle density, $p_{\text{particle}} = 2.65 \text{ gm/cm}^3$, from the Soil Screening Guidance (U.S. EPA, 1996b).

These values can be used as bounding estimates as maximums for AF using site-specific soil properties. The AF should not exceed these estimated values based on the mono-layer theory. To restate the recommendation of this guidance, construct the RME exposure scenario with a site-specific upper-end activity pattern, mean AF from Exhibit C-3, and upper-end exposure time. The uncertainty can be bounded by using these maximum estimated mono-layer AF values.

EXHIBIT C-3**OVERALL BODY PART-SPECIFIC WEIGHTED
SOIL ADHERENCE FACTORS**

	Age (years)	Weighted Soil Adherence Factor (mg/cm ²)	
		Geometric Mean	95 th Percentile
CHILDREN¹

Gardeners	>16	0.1	0.5
Construction Workers	>18	0.1	0.3

¹ Weighted AF based on exposure to face, forearms, hands, lower legs, & feet.

² Information on soil adherence values for the Children-in-Mud scenario is provided to illustrate the range of values for this type of activity. However, the application of these data to the dermal dose equations in this guidance may result in a significant overestimation of dermal risk. Therefore, it is recommended that the 95 percentile AF values not be used in a quantitative dermal risk assessment. See Exhibit C-4 for bounding estimates.

³ Weighted AF based on exposure to face, forearms, hands, & lower legs.

⁴ Weighted AF based on exposure to face, forearms, & hands.

Note: this results in different weighted AFs for similar activities between residential and commercial/industrial exposure scenarios.
